| 8 | F | 6 | L frontal, parietal, temporal | 3-4 | Distinct | — | 12 | 11 | 3 | 2 | 3 | 2 | Moderate/severe | 0.08 | 0.14 | 0.04 | 0.12 | 0.03 | 0.09 | 0.09 |
| 9 | F | 6 | L frontal, parietal, temporal | 4 | Distinct | — | 5 | 8 | 1 | 2 | 0 | 1 | No/mild | 0.03 | 1.00 | 0.03 | 0.05 | 0.02 | 0.00 | 0.00 |

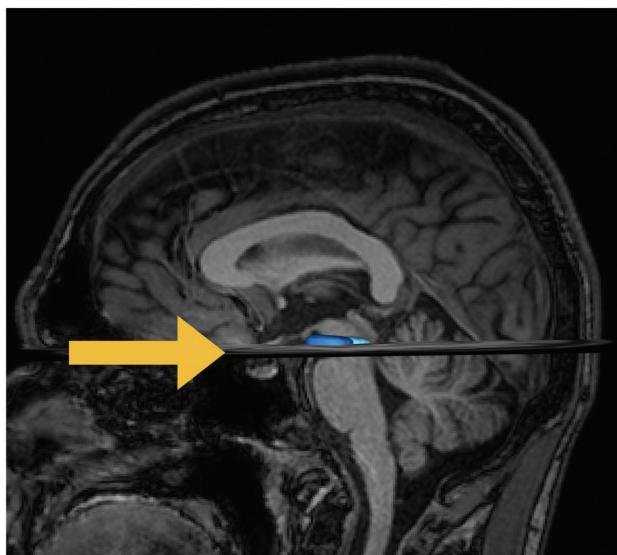

Note:—L indicates left; R, right; AI, asymmetry index.^a Hand motor strength rated according to the Medical Research Council scale.

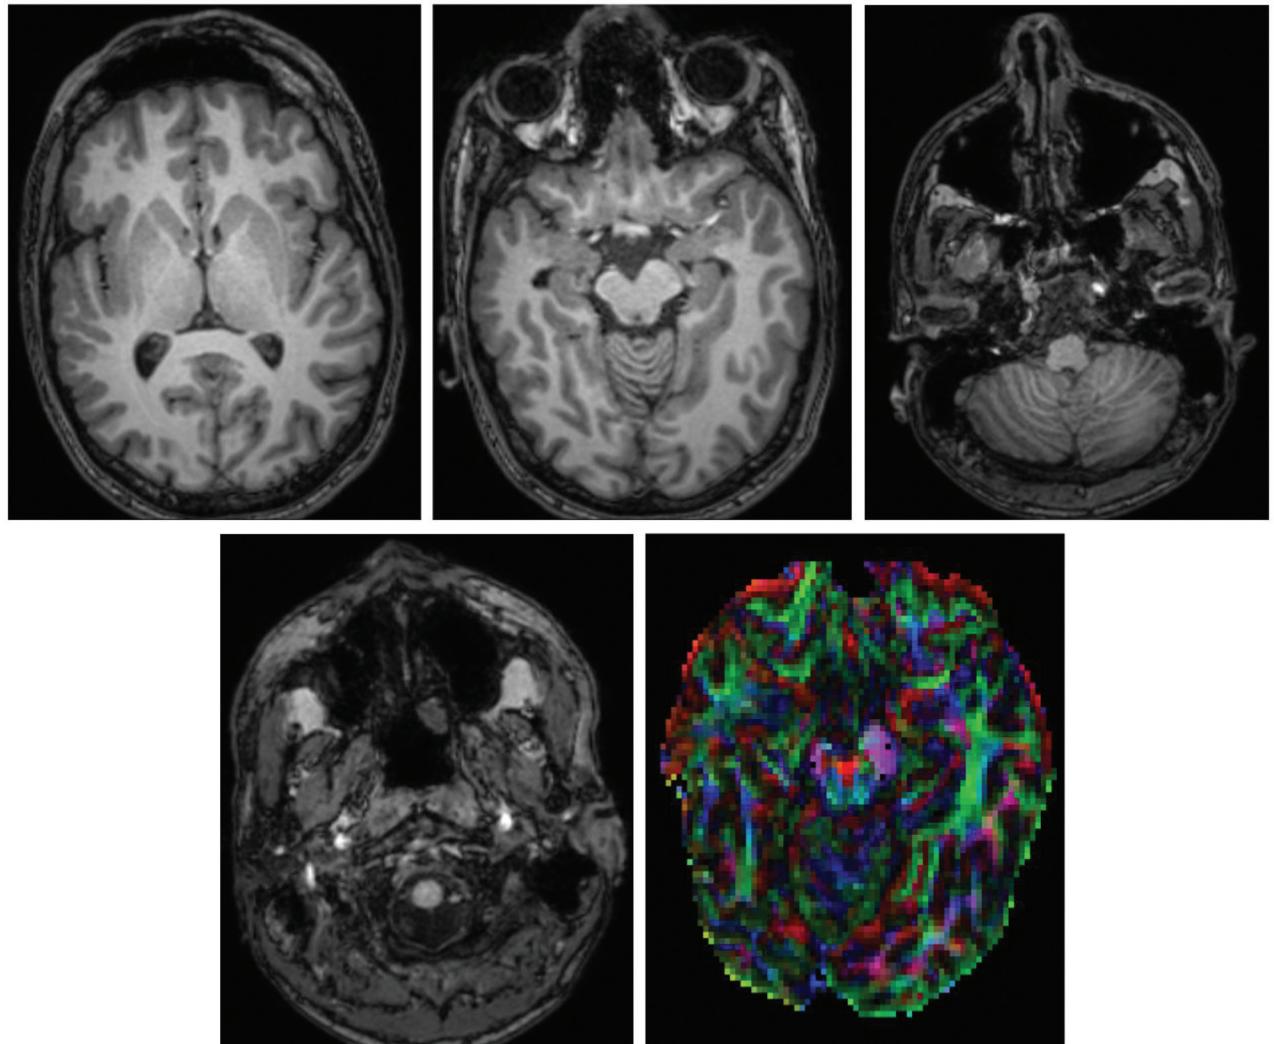

ON-LINE FIG 1. Axial T1WI of all patients (numbered 1–9 from left upper to right lower level) with polymicrogyria substantially involving the primary motor cortex.

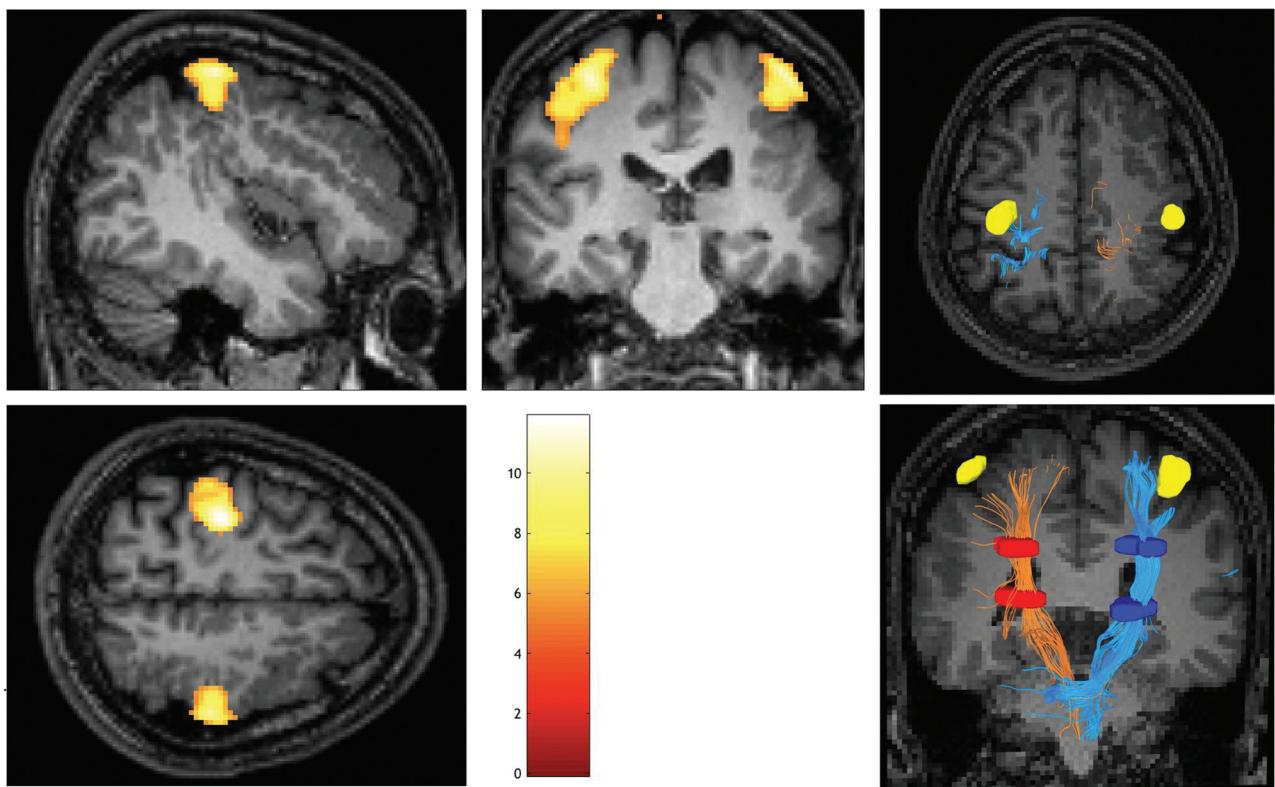

ON-LINE FIG 2. Manual segmentation of the brain stem (*upper row*) on TIWI. Manually defined ROIs of the internal capsule (*middle image*: whole left and right internal capsule; *right image*: only the posterior limb of the internal capsule) on color-coded DTI maps. Highly significant task-related activations were seen within the structurally altered central region. DTI tractography led to the same area of presumed primary motor cortex.

ON-LINE FIG 3. Axial height of the brain stem, where DTI parameters were measured (1 slice below the mammillary bodies).

ON-LINE FIG 4. CST characterization in patient 1: TIWI at different levels of the corticospinal tract (internal capsule, cerebral crus, medulla, spine), color-coded FA color map (brain stem). Asymmetry was altogether rated as moderate/severe. Hand motor function was severely impaired with no de novo deficit after hemispherectomy.

ON-LINE FIG 5. fMRI activation map (bilateral hand motor task, family-wise error of $<.05$, 6-voxel minimum cluster size) and DTI tractography of the CST in patient 1.
