Note:—Ane indicates anesthesia type; Aw, awake anesthesia; G, general anesthesia; NS, normal saline; Y, yes; N, no; H, hand; F, foot; M, mouth; L, lymphoma; Met, metastatic tumor; A, astrocytoma; O, oligodendrogloma; OA, oligoastrocytoma; AA, anaplastic astrocytoma; AO, anaplastic oligodendrogloma; GBM, glioblastoma multiforme; Preop, preoperative; Intraop, intraoperative.

^a Each number indicates the number of positive units after DCS. A 10 × 10 mm area on the exposed cortical surface was considered 1 unit of stimulation.

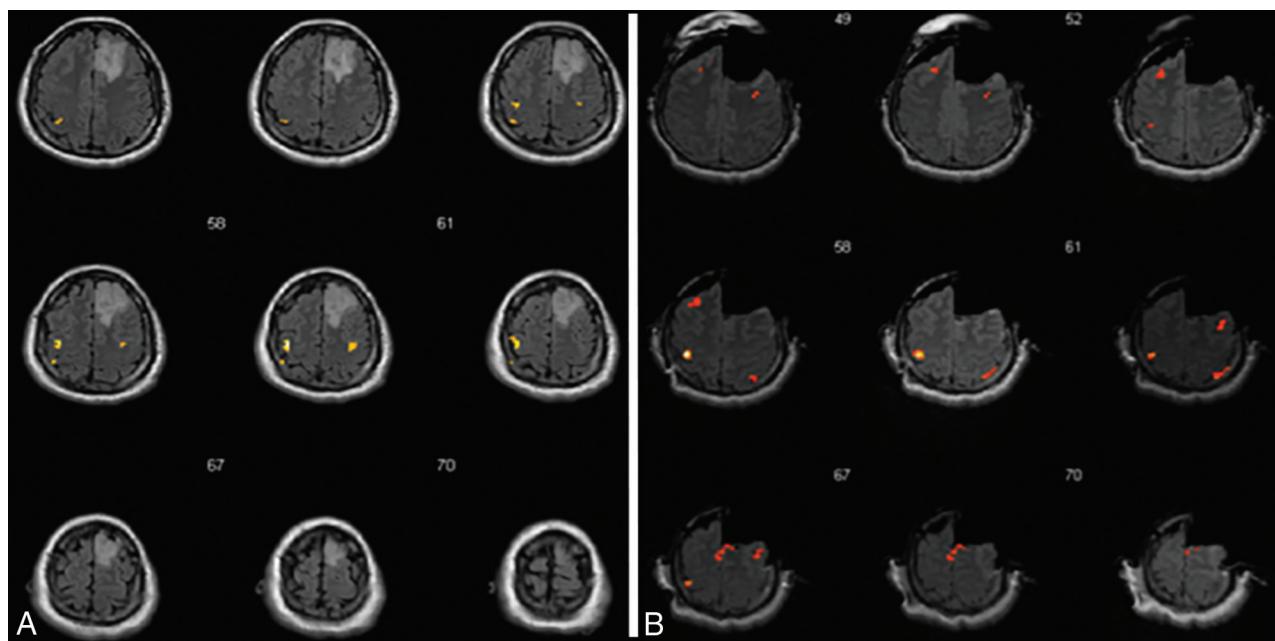

^b According to the 2007 World Health Organization Classification of Tumours of the Central Nervous System.

On-line Table 2: 4-fold table of the results of iR-fMRI and DCS^a

	iR-fMRI(+)	iR-fMRI(-)
DCS(+)	37	23
DCS(-)	10	148

Note:—TP indicates true-positive; TN, true-negative; FP, false-positive; FN, false-negative.

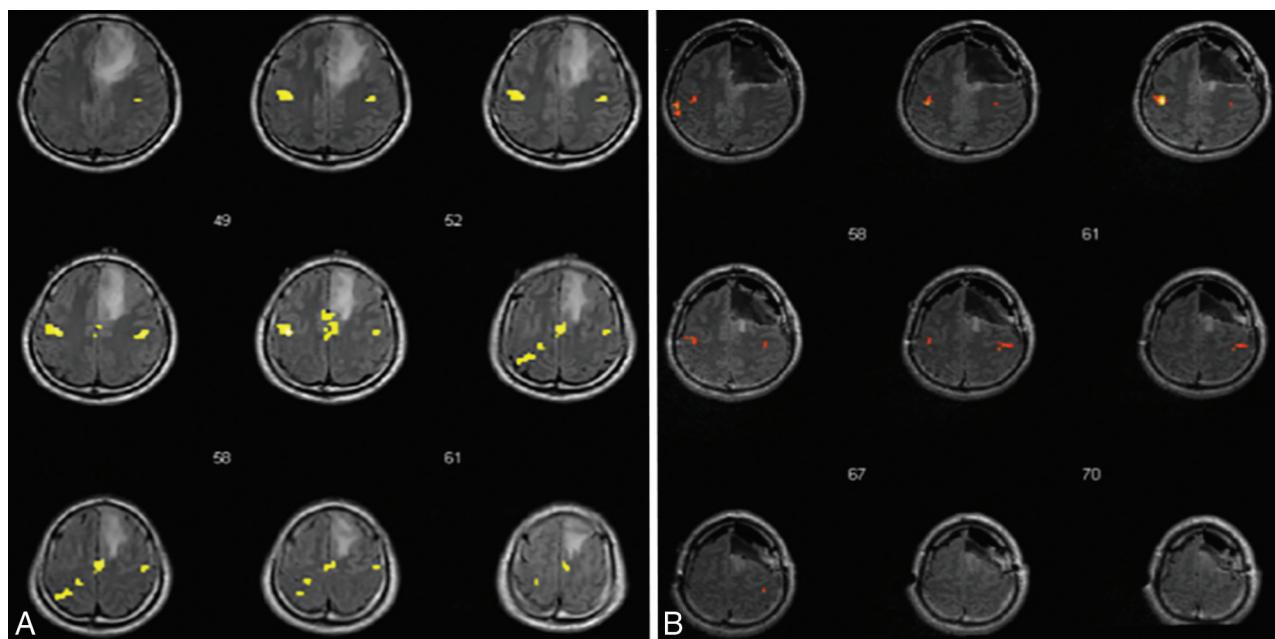

^a TP = 37, TN = 148, FP = 10, FN = 23.

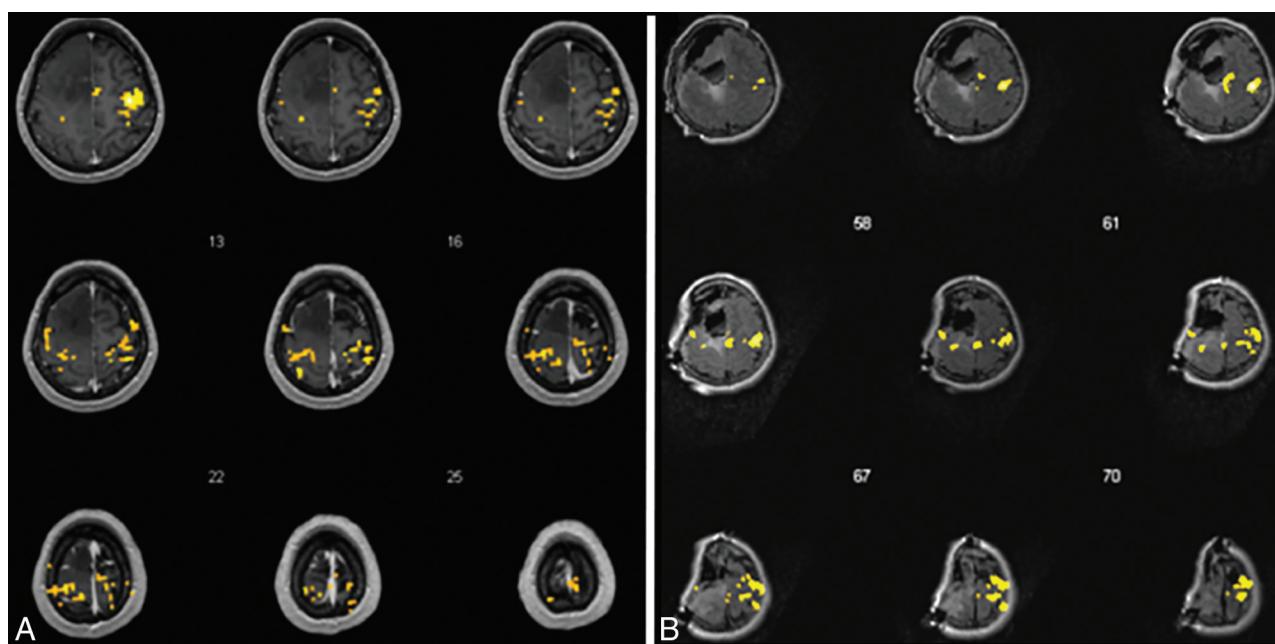

ON-LINE FIG 1. Preoperative R-fMRI and intraoperative R-fMRI of case 10 in On-line Table 1. The motor area is shown clearly on preoperative images, but obvious irrational motor functional connectivity is found in bilateral hemispheres on intraoperative images.

ON-LINE FIG 2. Preoperative R-fMRI and intraoperative R-fMRI of case 15 in On-line Table 1. Preoperative R-fMRI shows the bilateral motor area. However, irrational motor functional connectivity is found on iR-fMRI.

ON-LINE FIG 3. Preoperative R-fMRI and intraoperative R-fMRI of case 9 in On-line Table 1. Both preoperative and intraoperative R-fMRI show good results in the motor areas.

ON-LINE FIG 4. Preoperative R-fMRI and intraoperative R-fMRI of case 25 in On-line Table 1. Both preoperative and intraoperative R-fMRI show good results in the motor areas.
